

## Myers-Briggs type Indicator (MBTI®) Step II, Form Q

The Myers-Briggs Type Indicator® Form Q, also called Step II, is used for executive training and development. It was developed by Naomi Quenk from the work of Isabel Briggs Myers and her mother, Katharine Cook Briggs. Their aim was to create a tool to indicate, validate, and put to practical use C.G. Jung's work on psychological types. Jung (1875-1961) was a Swiss psychiatrist whose book Psychological Types was an outgrowth of his efforts to understand individual differences among people.

The Step II Profile presents your client's results graphically in just four pages, making it a good choice when interpretation time is limited. The client's Step I four-letter type is displayed first on this Profile. Next, his or her results on the 20 Step II facets are graphed. Brief descriptions on the graphs help the client understand the meaning of his or her Step II facet results.

The Profile concludes with an interpreter's summary, which provides the client's results in brief; the average range of scores of people of the client's MBTI® type; and the score on the polarity index, a measure of the consistency of Form Q responses.

The Myers-Briggs Type Indicator® Step II Instrument is a self-report questionnaire designed to make Jung's theory of psychological types understandable and useful in everyday life. MBTI® Instrument results identify valuable differences between normal, healthy people, differences that can be the source of much misunderstanding and miscommunication.
